

## 2022 DISTINGUISHED SENIOR

“Many members of my community recognize me as someone who is educated about the biology behind mosquitoes, ticks, and vector-borne disease, and being able to answer questions and educate the public has shown that what I am learning at my internship and education is truly important.”

As a double major in Entomology and Biology, I plan to attend medical school to study insect-vector-borne illness.

I volunteered at the James Cancer Hospital and Solove Research Institute throughout my undergraduate career.

I developed my own research project involving biological methods of insect control in Dr. Short's lab.
